3 Interpretation

3.1 Definitions

Operationally, $\mathit{Heap} \sqsubseteq \mathit{Loc} \times \mathit{Permission} \times \mathit{Matrix}$ (a multiset), denoted with a σ.
Define its *interpretation* to be $\mathit{Loc} \rightharpoonup \mathit{Permission} \times \mathit{Matrix}$ with $\star : \mathit{Heap} \times \mathit{Heap} \rightharpoonup \mathit{Heap}$ as follows:

$$(\varsigma_1 \star \varsigma_2)(l) \equiv \begin{cases} \varsigma_1(l) & \text{if } l \in \mathrm{dom}(\varsigma_1) \wedge l \notin \mathrm{dom}(\varsigma_2) \\ \varsigma_2(l) & \text{if } l \in \mathrm{dom}(\varsigma_2) \wedge l \notin \mathrm{dom}(\varsigma_1) \\ (f_1 + f_2, m) & \text{if } (f_1, m) = \varsigma_1(l) \wedge (f_2, m) = \varsigma_2(l) \wedge f_1 + f_2 \le 1 \\ \text{undefined} & \text{otherwise} \end{cases}$$

Commutativity and associativity of $\star$ follows from that of $+$.
$\varsigma_1 \star \varsigma_2$ is *defined* if it is for all $l \in \mathrm{dom}(\varsigma_1) \cup \mathrm{dom}(\varsigma_2)$.
Implicitly denote $\varsigma \equiv \mathcal{H}[\![\sigma]\!] \equiv \bigstar_{(l,f,m)\in\sigma}[l \mapsto_f m]$.

The $n-$fold iteration for the *StepsTo* (functional) relation, is also a (functional) relation:

$$\forall n.\ \mathbf{err} \to^n \mathbf{err} \qquad \langle \sigma, v\rangle \to^n \langle \sigma, v\rangle \qquad \langle \sigma, e\rangle \to^0 \langle \sigma, e\rangle \qquad \langle \sigma, e\rangle \to^{n+1} ((\langle \sigma, e\rangle \to) \to^n)$$

Hence, all bounded iterations end in either an **err**, a heap-and-expression or a heap-and-value.

4 Lemmas

4.1 $\forall \sigma_s, \sigma_r, e.\ \varsigma_s \star \varsigma_r$ **defined** $\Rightarrow \forall n.\ \langle \sigma_s, e\rangle \rightarrow^n = \langle \sigma_s + \sigma_r, e\rangle \rightarrow^n$

SUFFICES: By induction on n, consider only the cases $\langle \sigma_s, e\rangle \rightarrow \langle \sigma_f, e_f\rangle$ where $\sigma_s \neq \sigma_f$.

PROOF SKETCH: Only OP_{FREE, MATRIX, SHARE, UNSHARE_EQ, GEMM_MATCH} change the heap: the rest are either parametric in the heap or step to an **err**.

PROVE: $\langle \sigma_s + \sigma_r, e\rangle \rightarrow \langle \sigma_f + \sigma_r, e_f\rangle$.

$\langle 1\rangle 1$. CASE: OP_FREE, $\sigma_s \equiv \sigma' + \{l \mapsto_1 m\}$, $\sigma_f = \sigma'$.
PROOF: Instantiate OP_FREE with $(\sigma' + \sigma_r) + \{l \mapsto_1 m\}$,
valid because $l \notin \mathrm{dom}(\varsigma_r)$ by $\varsigma' \star [l \mapsto_1 m] \star \varsigma_r$ defined (assumption).

$\langle 1\rangle 2$. CASE: OP_MATRIX
PROOF: Rule has no requirements on σ_s so will also work with $\sigma_s + \sigma_r$.

$\langle 1\rangle 3$. CASE: OP_SHARE, $\sigma_s \equiv \sigma' + \{l \mapsto_f m\}$, $\sigma_f = \sigma' + \{l \mapsto_{\frac{1}{2}\cdot f} m\} + \{l \mapsto_{\frac{1}{2}\cdot f} m\}$.
PROOF: Union-ing σ_r does not remove $l \mapsto_f m$, so that can be split out of $\sigma_s + \sigma_r$ as before.

$\langle 1\rangle 4$. CASE: OP_UNSHARE_EQ, $\sigma_s \equiv \sigma' + \{l \mapsto_{\frac{1}{2}\cdot f} m\} + \{l \mapsto_{\frac{1}{2}\cdot f} m\}$, $\sigma_f = \sigma' + \{l \mapsto_f m\}$.

- $\langle 2\rangle 1$. Union-ing σ_r does not remove $l \mapsto_{\frac{1}{2}\cdot f} m$, so that can still be split out of $\sigma_s + \sigma_r$.
- $\langle 2\rangle 2$. There may also be other valid splits introduced by σ_r.
- $\langle 2\rangle 3$. However, by assumption of $\varsigma_s \star \varsigma_r$ defined, any splitting of $\sigma_s + \sigma_r$ will satisfy $f \leq 1$.

$\langle 1\rangle 5$. CASE: OP_GEMM_MATCH

- $\langle 2\rangle 1$. By assumption of $\varsigma_s \star \varsigma_r$ defined, either l_1 (or l_2, or both) are not in σ_r, or they are and the matrix values they point to are the same.
- $\langle 2\rangle 2$. The permissions (of l_1 and/or l_2) may differ, but OP_GEMM_MATCH universally quantifies over them and leaves them unchanged, so they are irrelevant.
- $\langle 2\rangle 3$. Only the pointed to matrix value at l_3 changes.
- $\langle 2\rangle 4$. SUFFICES: $l_3 \notin \pi_1[\sigma_r]$.
- $\langle 2\rangle 5$. By assumption of $\varsigma_s \star \varsigma_r$ defined, $l_3 \notin \mathrm{dom}(\varsigma_r)$.
- $\langle 2\rangle 6$. Hence $l_3 \notin \pi_1[\sigma_r]$.

4.2 $\forall k, t.\ \mathcal{V}_k[\![t]\!] \subseteq \mathcal{C}_k[\![t]\!]$

Follows from definition of $\mathcal{C}_k[\![t]\!]$, $\rightarrow^j$ $(\forall n.\ \langle \sigma, v\rangle \rightarrow^n \langle \sigma, v\rangle)$ for arbitrary $j \leq k$ and 4.1.

4.3 $\forall \theta, \delta, \gamma, v.\ \theta(\delta(\gamma(v)))$ **is a value.**

θ is irrelevant because it only maps fractional capability variables to fractional capabilities. By construction, δ and γ only map variables to values, and values are closed under substitution.

4.4 $\forall k, \sigma, \sigma', e, e', t.\ (\varsigma', e') \in \mathcal{C}_k[\![t]\!] \wedge \langle \sigma, e\rangle \to \langle \sigma', e'\rangle \Rightarrow (\varsigma, e) \in \mathcal{C}_{k+1}[\![t]\!]$

ASSUME: arbitrary $j < k+1$, and σ_r such that $\varsigma \star \varsigma_r$ defined.

$\langle 1\rangle 1$. CASE: $j = 0$. Clearly $\sigma_f = \sigma_s + \sigma_r$ and $e' = e$.
Remains to show that if e is a value then $(\varsigma_s \star \varsigma_r, e) \in \mathcal{V}_k[\![t]\!]$.
This is true vacuously, because by assumption, e is not a value.

$\langle 1\rangle 2$. CASE: $j \geq 1$. We have $\langle \sigma, e\rangle \to^j = \langle \sigma', e'\rangle \to^{j-1}$.
Instantiate $(\varsigma', e') \in \mathcal{C}_k[\![t]\!]$, with $j - 1 < k$ and σ_r to conclude the required conditions.

4.5 $j \leq k \Rightarrow \_\ _k[\![\cdot]\!] \subseteq \_\ _j[\![\cdot]\!]$

Lemma 4.4 is the inductive step for this lemma for the $\mathcal{C}[\![]\!]$ case.
Need to prove for $\mathcal{V}[\![]\!]$, by induction on t and then index.

SUFFICES: Consider only $t \multimap t'$ case, rest use k directly on structure of type.
ASSUME: Arbitrary $j \leq k$ and $(\varsigma_{v'}, v') \in \mathcal{V}_k[\![t \multimap t']\!]$.
PROVE: $(\varsigma_{v'}, v') \in \mathcal{V}_j[\![t \multimap t']\!]$.

$\langle 1\rangle 1$. v' is of the correct syntactic form (lambda or fixpoint) by assumption.

$\langle 1\rangle 2$. ASSUME: arbitrary $j' \leq j$ and $(\varsigma_v, v) \in \mathcal{V}_{j'}[\![t]\!]$ such that $\varsigma_{v'} \star \varsigma_v$ is defined.

$\langle 1\rangle 3$. SUFFICES: to show $(\varsigma_{v'} \star \varsigma_v, v'v) \in \mathcal{C}_{j'}[\![t']\!]$.

$\langle 1\rangle 4$. This is true by instantiating $(\varsigma_{v'}, v') \in \mathcal{V}_k[\![t \multimap t']\!]$ with $j' \leq k$ and $(\varsigma_v, v) \in \mathcal{V}_{j'}[\![t]\!]$.

4.6 $\forall \Delta, \Gamma, t, k, \theta, \delta, \gamma.\ \delta \in \mathcal{I}_k[\![\Delta]\!]\theta \wedge \gamma \in \pi_2[\mathcal{L}_k[\![\Gamma]\!]\theta] \Rightarrow \mathrm{dom}(\Delta) = \mathrm{dom}(\delta)$ **and** $\mathrm{dom}(\Gamma) = \mathrm{dom}(\gamma)$

PROOF: By induction on Δ and Γ.

4.7 $\forall k, \Gamma, \Gamma', \theta, \sigma_+, \gamma_+.\ (\varsigma_+, \gamma) \in \mathcal{L}_k[\![\Gamma, \Gamma']\!]\theta \wedge \Gamma, \Gamma'$ **disjoint** $\Rightarrow$
$\exists \sigma, \gamma, \sigma', \gamma'.\ \sigma_+ = \sigma + \sigma' \wedge \gamma, \gamma'$ **disjoint** $\wedge\ \gamma_+ = \gamma \cup \gamma'$
$\wedge\ (\varsigma, \gamma) \in \mathcal{L}_k[\![\Gamma]\!] \wedge (\varsigma', \gamma') \in \mathcal{L}_k[\![\Gamma']\!]$

PROOF: By induction on Γ'.

5 Soundness

$$\forall \Theta, \Delta, \Gamma, e, t.\ \Theta; \Delta; \Gamma \vdash e : t \Rightarrow \forall k.\ {}_k[\![\Theta; \Delta; \Gamma \vdash e : t]\!]$$

Proof sketch: Induction over the typing judgements.

Assume: 1. Arbitrary $\Theta, \Delta, \Gamma, e, t$ such that $\Theta; \Delta; \Gamma \vdash e : t$.
2. Arbitrary $k, \theta, \delta, \gamma, \sigma$ such that:
   a. $\Theta = \mathrm{dom}(\theta)$
   b. $(\varsigma, \gamma) \in \mathcal{L}_k[\![\Gamma]\!]\theta$
   c. $\delta \in \mathcal{I}_k[\![\Delta]\!]\theta$.
3. W.l.o.g., all variables are distinct, hence Θ, $\mathrm{dom}(\Delta)$ and $\mathrm{dom}(\Gamma)$ are disjoint so order of θ, δ and γ (as substitutions defined recursively over expressions) is irrelevant.

Prove: $(\varsigma, \theta(\gamma(\delta(e)))) \in \mathcal{C}_k[\![\theta(t)]\!]$.
Assume: Arbitrary $j < k$ and σ_r, such that $\varsigma \star \varsigma_r$ defined.
Suffices: $\langle \sigma + \sigma_r, e\rangle \to^j \mathbf{err} \ \vee \exists \sigma_f, e_f.\ \langle \sigma + \sigma_r, e\rangle \to^j \langle \sigma_f + \sigma_r, e_f\rangle$
$\wedge\ (e_f \text{ is a value } \Rightarrow (\varsigma_f \star \varsigma_r, e_f) \in \mathcal{V}_{k-j}[\![t]\!])$.
Suffices: By 4.1, to show $\langle \sigma, e\rangle \to^j \mathbf{err} \ \vee \exists \sigma_f, e_f.\ \langle \sigma, e\rangle \to^j \langle \sigma_f, e_f\rangle$
$\wedge\ (e_f \text{ is a value } \Rightarrow (\varsigma_f, e_f) \in \mathcal{V}_{k-j}[\![t]\!])$

⟨1⟩1. Case: Ty_Let.

⟨2⟩1. By induction,
1. $\forall k.\ {}_k[\![\Theta; \Delta; \Gamma \vdash e : t]\!]$
2. $\forall k.\ {}_k[\![\Theta; \Delta; \Gamma', x : t \vdash e' : t']\!]$.

⟨2⟩2. By 2b, 3 and 4.7, we know there exists the following (for all k):
1. $(\varsigma_e, \gamma_e) \in \mathcal{L}_k[\![\Gamma]\!]$
2. $\gamma = \gamma_e \cup \gamma_{e'}$
3. $\sigma = \sigma_e + \sigma_{e'}$.

⟨2⟩3. So, using $k, \theta, \delta, \gamma_e, \sigma_e$, we have $(\varsigma_e, \theta(\gamma_e(\delta(e)))) \in \mathcal{C}_k[\![\theta(t)]\!]$.

⟨2⟩4. By ⟨2⟩2 ($\gamma = \gamma_e \cup \gamma_{e'}$), have $(\varsigma_e, \theta(\gamma(\delta(e)))) \in \mathcal{C}_k[\![\theta(t)]\!]$.

⟨2⟩5. By definition of $\mathcal{C}_k[\![\cdot]\!]$ and ⟨2⟩2, we instantiate with j and $\sigma_r = \sigma_{e'}$ to conclude that $\langle \varsigma, \theta(\gamma(\delta(e)))\rangle$ either takes j steps to **err** or another heap-and-expression $\langle \sigma_f, \theta(\gamma(\delta(e_f)))\rangle$.

⟨2⟩6. Case: j steps to **err**
By Op_Context_Err, the whole expression reduces to **err** in $j < k$ steps.

⟨2⟩7. Case: j steps to another heap-and-expression.
If it is not a value, then Op_Context runs j times and we are done.

⟨2⟩8. If it is, then $\exists i \le j.\ (\varsigma_f, v_1) \in \mathcal{V}_{k-i}[\![\theta(t_1)]\!] \subseteq \mathcal{V}_{k-j}[\![\theta(t_1)]\!]$ by 4.3 and 4.5.
So, Op_Context runs i times, and then we have the following.
Suffices: $(\varsigma_f \star \varsigma_{e'}, \mathbf{let}\ x\ =\ v\ \mathbf{in}\ \theta(\gamma(\delta(e')))) \in \mathcal{C}_{k-i}[\![\theta(t')]\!]$ by 4.4 i times.
Suffices: $(\varsigma_f \star \varsigma_{e'}, \theta(\gamma(\delta(e')))[x/v]) \in \mathcal{C}_{k-i-1}[\![\theta(t')]\!]$ by 4.4.

⟨2⟩9. By 4.5, $(\varsigma_{e'}, \gamma_{e'}[x \mapsto v]) \in \mathcal{L}_k[\![\Gamma', x : t]\!]\theta \subseteq \mathcal{L}_{k-i-1}[\![\Gamma', x : t]\!]\theta$.

⟨2⟩10. Instantiate 2 of step ⟨2⟩1 with $k - i - 1, \theta, \delta, \gamma_{e'}[x \mapsto v], \sigma_{e'}$ to conclude $(\varsigma_{e'}, \theta(\gamma_{e'}[x \mapsto v](\delta(e')))) \in \mathcal{C}_{k-i-1}[\![\theta(t')]\!]$.

⟨2⟩11. By 3, we have $\theta(\gamma(\delta(e')))[x/v] = \theta(\gamma_{e'}[x \mapsto v](\delta(e')))$ and
